Defines	msv-supercategory
Defines	classes of molecular set variables and their chemical transformations with tim

Definition 0.1. A *supercategory of variable molecular sets (or molecular set variables)*, $\S_{msv}$ is defined as the supercategory whose class of objects is the class of all possible variable molecular sets, msv's, (or molecular set variables), and whose class of morphisms is the class of all molecular transformations, η_t, of msv's.

Remark All such msv–supercategories are semantic interpretations of the ETAS axioms (syntax). This is a mathematical representation of chemical reaction systems in terms of molecular sets that vary with time (or msv's, and their transformations as a result of diffusion, collisions, and chemical reactions.
